(iii) When 1 – chloropentane is treated with NaOH, pentan – 1 – ol is produced.

Q 11.14:

Give two reactions that show the acidic nature of phenol. Compare acidity of phenol with that of ethanol.

Solution:

The acidic nature of phenol can be proven with the two reactions given below:

(i) Phenol reacts with sodium to give sodium phenoxide, liberating H₂.

(ii) Phenol reacts with sodium hydroxide to give sodium phenoxide & water as by-products.

Solution:

Ethanol experiences intermolecular H – bonding because of the presence of – OH group, which results in the association of molecules. additional energy is necessary to break these hydrogen bonds. Conversely, methoxymethane does not experience H – bonding. Therefore, ethanol has a higher boiling point when compared to methoxymethane

Q 11.23:

Give IUPAC names of the following ethers:
